## DESCRIPTION/ORDERING INFORMATION

The TS3DV520E is a 20 -bit to 10 -bit multiplexer/demultiplexer digital video switch with a single select (SEL) input. SEL controls the data path of the multiplexer/demultiplexer. The device provides five differential channels for digital video signal switching.
This device provides low and flat ON -state resistance ( $\mathrm{r}_{\mathrm{on}}$ ) and excellent ON -state resistance match. Low input/output capacitance, high bandwidth, low skew, and low crosstalk among channels make this device suitable for various digital video applications, such as DVI and HDMI.
This device is specified for partial-power-down applications using $\mathrm{I}_{\text {offf }}$. The $\mathrm{I}_{\text {off }}$ feature ensures that damaging current will not backflow through the device when it is powered down. The device has isolation during power off.
Voltage on the SEL pin should be less or equal to $\mathrm{V}_{\mathrm{CC}}$, even in the power-down mode $\left(\mathrm{V}_{\mathrm{CC}}=0 \mathrm{~V}\right)$.
